

Self-serve research automation upgrade

Prepared by Nakul as an independent freelancer/sole proprietor for Eli Malone-Shkurkin / research automation. This is a bounded first milestone inside the broader expansion. This does not include spam, scraping restricted sources, bypassing site rules, or claiming unsupported data coverage.

Buyer	Eli Malone-Shkurkin / research automation
Opportunity	Daily industry research automation needs scaling into a self-serve multi-client setup.
Package	USD 3,800 fixed for one self-serve onboarding and output path - Self-serve research automation upgrade
Path	Forum/DM path only unless Eli provides an email. Keep data-source permissions explicit.

Fit

The buyer already has a working automation direction. The immediate value is turning it into a repeatable onboarding and delivery system.

Area	Support deliverable
1	Client configuration schema for industry, sources, cadence, output style, and owner
2	Onboarding form or table plan that creates a new client run without manual scenario edits
3	Google Doc or Drive provisioning pattern with naming, folders, and permissions checklist
4	Persistence cleanup for run state, duplicate prevention, and source-level result tracking
5	Failure logging and alert rules for empty runs, source failures, and output errors
6	Handoff doc with one sample client configured end to end

Boundary

No scraped/private data or client secrets should be shared by forum DM; use an approved source list and dummy client config first.

USD 3,800 fixed for one self-serve onboarding and output path	Reply in Make Community/DM with the packet link and ask for one sample client config, current scenario shape, and desired output format.
